

E-Band Power Amplifier

71 - 86 GHz, 1 W, High Linearity

MAAP-011388-DIE

Rev. V2

Features

- High Gain: 28 dB
- P1dB: 29 dBm
- P3dB: 31 dBm
- Output IP3: 42 dBm
- Bias Voltage: $V_{DD} = 4$ V
- Bias Current: $I_{DSQ} = 2850$ mA
- 50 Ω Matched Input / Output
- Output Power Detector
- Die Size: 4.0 x 4.3 x 0.05 mm
- RoHS* Compliant

Applications

- Satellite Communications
- Point-to-Point Communications
- Radar Front Ends
- Test and Measurement
- Automotive Radar

Description

The MAAP-011388-DIE is a 1 W power amplifier. The power amplifier operates from 71 to 86 GHz and provides 28 dB of linear gain (at nominal bias conditions) and 31 dBm of output power at 6 dB compression. The device is fully matched across the band and includes an output power detector. The data contained within this datasheet is probed directly on the die.

The MAAP-011388-DIE can be used as a power amplifier stage or as a driver stage in higher power applications.

This product is fabricated using a GaAs pHEMT process which features full passivation for enhanced reliability.

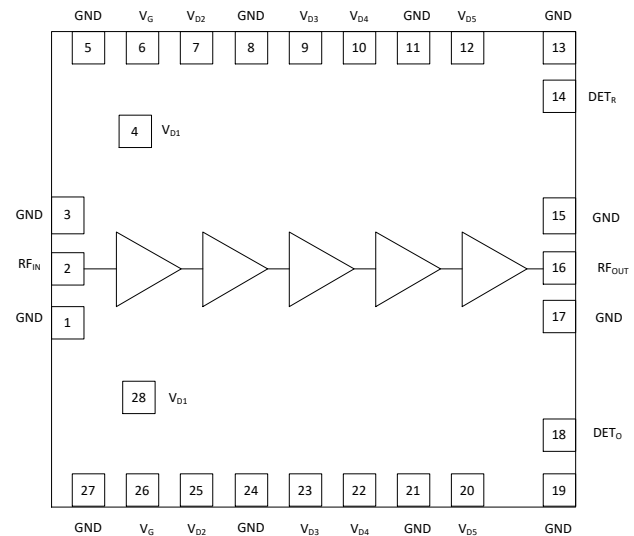

All data was measured on die using RF probes.

Ordering Information

Part Number	Package
MAAP-011388-DIE	Gel Pack ¹

1. Die quantity varies.

Functional Schematic

Pin Configuration²

Pin #	Pin Name	Description
1,3,15,17	RF GND	RF ground
2	RF _{IN}	RF Input
4, 28	V _{D1}	Drain voltage 1
5,8,11,13,19,21,24,27	DC GND	DC ground
6,26	V _G	Gate voltage
7,25	V _{D2}	Drain voltage 2
9,23	V _{D3}	Drain voltage 3
10,22	V _{D4}	Drain voltage 4
12,20	V _{D5}	Drain voltage 5
14	DET _R	Detector Reference
16	RF _{OUT}	RF Out
18	DET _O	Detector Output
		Backside of die ²

2. Backside of die must be connected to RF, DC and thermal ground.

1 * Restrictions on Hazardous Substances, compliant to current RoHS EU directive.

Output Return Loss	$P_{IN} = -20\text{ dBm}$	dB	—	12	—

Maximum Operating Ratings

Parameter	Rating
Input Power	12 dBm
Junction Temperature ^{4,5}	+150°C
Operating Temperature	-40°C to +85°C

4. Operating at nominal conditions with junction temperature $\leq +150^\circ\text{C}$ will ensure MTTF $> 1 \times 10^6$ hours.
5. Junction Temperature (T_J) = $T_C + \Theta_{JC} * ((V * I) - (P_{OUT} - P_{IN}))$
Typical thermal resistance (Θ_{JC}) = 4°C/W .
- a) For $I_{DSQ} = 2850\text{ mA}$, $T_C = +85^\circ\text{C}$, defined as backside of die.
 $T_J = 137^\circ\text{C}$ @ 4 V, 3500 mA, $P_{OUT} = 30\text{ dBm}$, $P_{IN} = 10\text{ dBm}$

Absolute Maximum Ratings^{6,7}

Parameter	Absolute Maximum
Input Power	15 dBm
Drain Voltage	+4.5 V
Gate Voltage	-2 V to +0.3 V
Junction Temperature ⁸	+175°C
Storage Temperature	-65°C to +125°C

6. Exceeding any one or combination of these limits may cause permanent damage to this device.
7. MACOM does not recommend sustained operation near these survivability limits.
8. Junction temperature directly effects device MTTF. Junction temperature should be kept as low as possible to maximize lifetime.

Recommended Operating Conditions

It is recommended to operate at a typical drain voltage of +4 V $\pm 5\%$. The maximum recommended operating drain current is fundamentally defined by the combination of the maximum operating junction temperature and the power dissipated. This can be calculated as shown in note 5.

Electrostatic Sensitivity

These electronic devices are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these class 1A HBM devices.

Pin Configuration and Functional Descriptions

Pin #	Pin Name	Description
1,3,15,17	RF GND	These pads are grounded on the MMIC. They are intended to support both on-wafer G-S-G probing for production test and also the use of RF GND bonds if required in the application.
2	RF _{IN}	RF Signal Input. This pad is matched to 50 Ω and is AC coupled.
4, 28	V _{D1}	Drain biases for stage 1 of the amplifier. External bypass capacitors, de-Q resistors and bead inductors are required as described in the applications schematic. There is no internal connection between pads 4 and 28 and so both pins need to be externally connected to the same voltage.
5,26	V _G	Power amplifier gate controls. Adjust V _G from -1.5 V to 0 V to achieve the desired quiescent current. External bypass capacitors and de-Q resistors are required as described in the applications schematic. There is no internal connection between pads 5 and 26 and so both pins need to be externally connected to the same voltage.
7,25	V _{D2}	Drain biases for stage 2 of the amplifier. External bypass capacitors, de-Q resistors and bead inductors are required as described in the applications schematic. There is no internal connection between pads 7 and 25 and so both pins need to be externally connected to the same voltage.
9,23	V _{D3}	Drain biases for stage 3 of the amplifier. External bypass capacitors, de-Q resistors and bead inductors are required as described in the applications schematic. There is no internal connection between pads 9 and 23 and so both pins need to be externally connected to the same voltage.
10,22	V _{D4}	Drain biases for stage 4 of the amplifier. External bypass capacitors, de-Q resistors and bead inductors are required as described in the applications schematic. There is no internal connection between pads 10 and 22 and so both pins need to be externally connected to the same voltage.
12,20	V _{D5}	Drain biases for stage 5 of the amplifier. External bypass capacitors, de-Q resistors and bead inductors are required as described in the applications schematic. There is no internal connection between pads 12 and 20 and so both pins need to be externally connected to the same voltage.
14	DET _R	Detector Diode Reference voltage. This provides a reference voltage to compensate for temperature effects of the power detector output (DET _O). An external comparator circuit can be used as described in the applications section.
16	RF _{OUT}	RF Signal Output. This pad is matched to 50 Ω and is AC coupled
18	DET _O	Detector Diode Output voltage. When biased using an external resistor as described in the applications section, this provides an output voltage proportional to the RF output power. Used in conjunction with DET _R , temperature effects can be compensated for. The voltage DET _R —DET _O is a temperature compensated DC voltage proportional to the RF output power of the PA.

Application Circuit Notes

The MAAP-011388-DIE incorporates on-chip 100 pF bypass capacitors for all the drain connections. This eliminates the requirement to include 100pF chip capacitors as close as possible to the MMIC. However, these can be included if desired.

C1 to C12 are SMT components which can be mounted on the application PCB, with the appropriate traces being bonded directly to the MMIC. These should be placed as closely as practically possible to the MMIC.

The circuit is not sensitive to the positioning of C13 and C14, however these should be on the same PCB as the rest of the biasing components.

Biasing Conditions

Recommended biasing conditions are $V_{DD} = 4$ V, $I_{DSQ} = 2850$ mA

V_G must be applied to pinch off the device before V_{DD} is applied.

V_{DD} Bias must be applied from both north and south bonding pads. V_{DD} and V_G bias lines are not connected internally.

Operating the MAAP-011388-DIE

Turn-on

1. Apply V_G (-1.5 V).
2. Increase V_{DD} to 4 V.
3. Set I_{DSQ} by adjusting V_G more positive (typically -0.55 V for $I_{DSQ} = 2850$ mA).
4. Apply RF_{IN} signal.

Turn-off

1. Remove RF_{IN} signal.
2. Decrease V_G to -1.5 V.
3. Decrease V_{DD} to 0 V.

Handling Procedures

Please observe the following precautions to avoid damage:

Static Sensitivity

These electronic devices are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these HBM Class 1A devices.

Wire Bonding

The loop height of the RF bonds should be minimized. Where the die is mounted above the PCB, it is recommended to use Reverse Ball-Stitch-on-Ball bonds (BSOB). If the die is mounted inside a cavity on the board, forward loop bonding may result in a lower loop height. V-shape RF bond with two wires (diameter = 25 μm) is recommended for optimum RF performance. RF bond wire length to be minimized to reduce the inductance effect. Simulations suggest no more than 300 μm . Substrate RF pad can be optimized to improve the microstrip to MMIC bond transition as shown in the example below.

Alternatively, a 3 mil bond ribbon could be used.

Detector biasing schematic

As shown in the schematic below, the power detector is implemented by providing 5 V bias and measuring the difference in output voltage. This measure can be achieved by mean of either standard op-amp in a differential mode configuration or analog-to-digital converters.

Handling the Die

This MMIC has fragile exposed airbridges on its surface and must be handled on the edges only using a vacuum collet or suitable tweezers. Do not touch the surface of the chip with a vacuum collet, tweezers, or fingers.

Die Attach

For mounting the die either an electrically conductive epoxy, or an AuSn eutectic preform can be used.

If using eutectic, an 80% Au / 20% Sn preform is recommended. If using epoxy, a high thermal conductivity epoxy is required and a silver sintering type epoxy is recommended.

Thermal Considerations

Due to the high power dissipation of this high linearity PA, careful consideration needs to be given to the thermal path in the application. The thermal path to the heatsink must be designed to have sufficiently low thermal resistance to support a maximum of 85°C temperature at the backside of the die.

Directly mounting to a metal heatsink using one of the die attach methods outlined is highly recommended. If the MMIC is to be mounted onto a PCB, an embedded copper coin is recommended in the die attach area.
