Description

The MAMF-011153 is a highly integrated, broadband, high power switched LNA module. Including a 2-stage low noise amplifier, PIN diode switch, pin diode driver and DC-DC converter all in a compact low cost 8 mm QFN package. Mixed technologies are used to achieve high power handling, low noise figure, and low power consumption. The module only needs a single +5 V supply. T/R switch and LNA can be controlled with 1.8 V or 3.3 V logic.

Handling Procedures

Please observe the following precautions to avoid damage:

Static Sensitivity

These electronic devices are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these devices. HBM Class 1C, CDM Class C3.

Recommended Operating Conditions

Parameter	Conditions	Unit	Min.	Typ.	Max.
Antenna Input Power	Freq. = 3.5 GHz: RX Mode TX Mode	dBm	—	-30 47	-10 48
DC Voltages: RXOUT VCC T/R	—	V	0 4.5 0	0 5 0/1.8	+2.75 +5.5 +3.6

Junction Temperature: RX Mode ^{5,6} TX Mode	—	°C	—	—	+140 +165
Storage Temperature	—	°C	-65	—	+150

4. Operating/Case Temperature (T_C) is measured at the exposed pad.
 5. Operating at nominal conditions with $T_J \leq +125^\circ\text{C}$ will ensure MTTF > 1×10^6 hours.
 6. Junction Temperature (T_J) = $T_C + \Theta_{JC} * P_{DISS}$ where P_{DISS} is the total DC & RF dissipated power.
 • RX Mode: Typical thermal resistance (Θ_{JC}) = 33.4 °C/W.

7. Exceeding any one or combination of these limits may cause permanent damage to this device.
 8. MACOM does not recommend sustained operation near these survivability limits.
 9. Single event, up to 10 seconds duration.

Power Supplies

De-coupling capacitors should be placed at the VCC supply pin to minimize noise and fast transients. Supply voltage change or transients should have a slew rate smaller than 1 V / 10 μ s. In addition, all control pins should remain at 0 V (+/- 0.3 V) and no RF power should be applied while the supply voltage ramps or while it returns to zero.
