## Description

The MAMF-011156 is a compact surface mount, highly integrated high power SPDT switch and 2-stage low noise amplifier (LNA) module. It includes an antenna switch and a LNA in a compact 3 mm QFN package. All the bias circuitry and matching components are internal to the module.

This module operates from $1-6 \mathrm{GHz}$ and features high power handling, low noise figure, high linearity and low power consumption. The module requires a single 5 V supply and the T/R switch is 1.8 V CMOS compatible.

5. Exceeding any one or combination of these limits may cause permanent damage to this device.
6. MACOM does not recommend sustained operation near these survivability limits.
7. Single event, up to 10 seconds duration.
8. Operating at nominal conditions with $T_{j} \leq+150^{\circ} \mathrm{C}$ (RX Mode, LNA), $\mathrm{T}_{j} \leq+125^{\circ} \mathrm{C}$ (RX Mode, Switch) and $\mathrm{T}_{j} \leq+125^{\circ} \mathrm{C}$ (TX Mode) will ensure MTTF >> $1 \times 10^{6}$ hours.
9. Operating/Case temperature $\left(T_{C}\right)$ is the temperature of the exposed paddle.
10. Junction Temperature $\left(T_{J}\right)=T_{C}+\Theta_{J C} * P_{D I S s}$ where $P_{\text {DISs }}$ is the total DC \& RF dissipated power.

- RX Mode: Typical thermal resistance $\left(\Theta_{\mathrm{Jc}}\right)=33.4^{\circ} \mathrm{C} / \mathrm{W}$.
- TX Mode: Typical thermal resistance $\left(\Theta_{\mathrm{Jc}}\right)=15.3^{\circ} \mathrm{C} / \mathrm{W}$.

## Handling Procedures

Please observe the following precautions to avoid damage:

## Static Sensitivity

These electronic devices are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these devices.

| Parameter | Rating | Standard |
| :---: | :---: | :---: |
| Human Body <br> Model (HBM) | $500 ~ V$ <br> (Class 1B) | ESDA/JEDEC <br> JS-001 |
| Charged Device <br> Model (CDM) | $1000 ~ V$ <br> (Class C3) | ESDA/JEDEC <br> JS-002 |

## Power Supplies

De-coupling capacitors should be placed at the $\mathrm{V}_{\mathrm{DD}}$ supply pin to minimize noise and fast transients. Supply voltage change or transients should have a slew rate smaller than $1 \mathrm{~V} / 10 \mu \mathrm{~s}$. In addition, all control pins should remain at $0 \mathrm{~V}(+/-0.3 \mathrm{~V})$ and no RF power should be applied while the supply voltage ramps or while it returns to zero.
